DEVIATION TESTS

No. 1 from _____
This well was drilled to 3566'. In sandy line (approximately 3' into the
bed) before production casing was run. After setting and cementing 7"
casing at 3555' and allowing time for the cement to set, the plug was
drilled and the well drilled to a total depth of 3574'. Tubing was run
to bottom and the well flowed 175 barrels of pipe line oil in 7 hours
with 800' of 885'. This well was then drilled to total depth of 3586'
and completed with initial production of 254 barrels of pipe line oil,
flowing through tubing, in 21 hours, with 800' of 885'.

It is of the greatest importance to have a complete history of the well. Please state in detail the dates of redrilling, together
with the reasons for the work and its results. If there were any changes made in the casing, state fully, and if any casing was
"sidetracked" or left in the well, give its size and location. If the well has been dynamited, give date, size, position, and number
of shots. If plugs or bridges were put in to test for water, state kind of material used, position, and results of pumping or bailing.
