2010 RELEASE UNDER E.O. 14176

When a rigid material is subjected to a tensile force, it is subjected to elongation. The amount of elongation is directly proportional to the force applied and inversely proportional to the cross-sectional area of the material. This relationship is known as Hooke's Law and is expressed mathematically as  $F = kx$ , where  $F$  is the force,  $x$  is the elongation, and  $k$  is the spring constant. The spring constant is a measure of the stiffness of the material and is determined by its material properties and geometry. For example, a stiffer material will have a higher spring constant than a more flexible material. Similarly, a thicker material will have a higher spring constant than a thinner material of the same material.

$$1.00 \times 10^{-2} \text{ mol dm}^{-3} \times 0.020 \text{ dm}^3 \times 1000 \text{ g mol}^{-1} = 0.20 \text{ g dm}^{-3}$$

1. The first step is to identify the problem. This involves understanding the current situation and the goals that need to be achieved.
