

NEW MEXICO OIL CONSERVATION COMMISSION

Santa Fe, New Mexico

MISCELLANEOUS REPORTS ON WELL

Submit this report in triplicate to the Oil Conservation Commission or its proper agent within ten days after the work specified is completed. It should be signed and sworn to before a notary public for reports on beginning drilling operations, results of shooting well, results of test of casing shut-offs, result of plugging of well, and other important operations, even though the work was witnessed by an agent of the commission. Reports on minor operations need not be signed and sworn to before a notary public. See additional instructions in the Rules and Regulations of the Commission.

Indicate nature of report by checking below:

REPORT ON BEGINNING DRILLING OPERATIONS		REPORT ON REPAIRING WELL	
REPORT ON RESULT OF SHOOTING OR CHEMICAL TREATMENT OF WELL		REPORT ON PULLING OR OTHERWISE ALTERING CASING	
REPORT ON RESULT OF TEST OF CASING SHUT-OFF	X	REPORT ON DEEPENING WELL	
REPORT ON RESULT OF PLUGGING OF WELL			

Lovington, New Mexico.

March 18th, 1939.

Title

THEORY OF THE EARTH AND ITS HISTORY

BY J. W. GIBBS

NEW YORK: THE MACMILLAN COMPANY, 1907

This book is a reprint of the first edition, published in 1890, and is intended to serve as a text-book for students of geology. It is written in a simple, clear, and concise manner, and is suitable for use in both high schools and colleges. The book is divided into two parts, the first of which deals with the general principles of geology, and the second with the history of the earth.

THE GENERAL PRINCIPLES OF GEOLOGY

1. The earth is a sphere, and its surface is covered by a thin layer of water, which is called the hydrosphere. The land is covered by a thin layer of soil, which is called the lithosphere.

2. The earth is composed of different layers, or strata, which are called rocks. These rocks are formed by the action of different forces, and are of different ages. The oldest rocks are found at the bottom of the strata, and the youngest at the top.

3. The rocks are divided into three classes, namely, igneous, sedimentary, and metamorphic. Igneous rocks are formed from molten material, sedimentary rocks from the accumulation of sediments, and metamorphic rocks from the transformation of other rocks.

4. The rocks are further divided into different groups, and each group is characterized by certain features. These features are called fossils, and they are used to determine the age of the rocks.

5. The fossils are divided into different classes, and each class is characterized by certain features. These features are called characteristics, and they are used to determine the age of the fossils.

6. The fossils are further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the fossils.

THE HISTORY OF THE EARTH

7. The history of the earth is divided into different periods, and each period is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

8. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

THE HISTORY OF THE EARTH

9. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

10. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

11. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

12. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

THE HISTORY OF THE EARTH

13. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

14. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

15. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

16. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.

17. The history of the earth is further divided into different groups, and each group is characterized by certain features. These features are called characteristics, and they are used to determine the age of the earth.
