1. The first step in the process of identifying a problem is to determine the nature of the problem. This involves gathering information about the problem and its context. The second step is to identify the causes of the problem. This involves analyzing the information gathered in the first step to determine what factors are contributing to the problem. The third step is to develop a plan to address the problem. This involves identifying the steps that need to be taken to solve the problem and determining the resources that will be needed. The fourth step is to implement the plan. This involves putting the plan into action and monitoring the progress. The fifth step is to evaluate the results. This involves assessing the effectiveness of the plan and determining whether the problem has been solved. If the problem has not been solved, the process may need to be repeated.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were grown in the YEA medium for 24 h at 28 °C. The cell concentration of the strains was adjusted to 10⁸ cells/ml. The cell suspension was mixed with the plant tissue and the transformation efficiency was determined. The results were expressed as the mean ± SD of three independent experiments. The asterisks indicate the significant difference between the strains at the same concentration of the cell suspension.
