

Well was drilled to total depth of 4980' and plugged back to 4153' with 7" casing set at 4555'. Well is now producing gas from the Queens formation through casing perforations from 3891' to 3911'. We plan to kill well, drill plugs and deepen from present TD of 4980' to approx. 6200' in Paddock formation. A 5" liner will be set from near bottom to approx. 100' inside 7" casing, and cemented with sufficient cement to tie in 7" casing. Request for dual completion to be filed by appropriate application upon determining productivity of the Paddock formation.
