THE EFFECT OF VARIOUS FACTORS ON THE RATE OF
RECOVERY FROM THE EFFECTS OF ANESTHESIA
BY
J. H. HARRIS, M.D., AND
J. H. HARRIS, JR., M.D.

From the Department of Anesthesiology, University of Chicago, Chicago, Ill.

Abstract

The rate of recovery from the effects of anesthesia was studied in a series of experiments on dogs. The factors investigated were the type of anesthetic, the dose, the duration of anesthesia, the method of administration, and the condition of the animal. The results showed that the rate of recovery was influenced by all of these factors, and that the most rapid recovery was obtained when the animal was in good health and the anesthetic was administered in a controlled manner.

• The rate of recovery from the effects of anesthesia was studied in a series of experiments on dogs.

• The results showed that the rate of recovery was influenced by all of these factors.

• The most rapid recovery was obtained when the animal was in good health and the anesthetic was administered in a controlled manner.
