DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudlogging jobs, cementing points, and all other important proposed work)

It is our intention to drill a well at the above location to a TD of approximately 8500' with rotary tools, in order to test the Abo formation for oil production.

All casing points will be cemented in accordance with a proved method of the USGS, and we shall comply with any special requirements.

It is planned to use the following casing pattern: 13 3/8" surface string to be set at approximately 325' and cemented with 250 sacks to surface; 9 5/8" intermediate string to be set at approximately 4200' and cemented with 1800 sacks cement; 7" production string to be set at approximately 8500' and cemented with 1250 sacks.

Approval to produce this well upon completion is also requested.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
