New Mexico

(State or Territory)

The elevation of the derrick floor above sea level is 3708 ft. Approximately.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Set and cemented 1326' of 9-5/8" OD, 40#, 8thd., seamless casing (42 Jts.) at 1344' with 700 sacks of El Toro common cement. Completed cementing at 4:00 PM. 7-21-37.

Drilled plug at 1:00 PM. 7-24-37. Tested casing before and after drilling plug with 1300# pressure. Tested OK.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.

Title District Superintendent

1. The first part of the document is a letter from the author to the reader, explaining the purpose of the study and the methods used. The author states that the study is a cross-sectional study and that the data were collected from a random sample of the population. The author also mentions that the study was approved by the ethics committee of the institution.

2. Results of the study

The results of the study are presented in the following table. The table shows the distribution of the variables studied, as well as the results of the statistical tests. The first column shows the variable, the second column shows the number of subjects in each category, and the third column shows the percentage of the total sample. The fourth column shows the results of the chi-square test, and the fifth column shows the p-value.

Variable	Number of subjects	Percentage	Chi-square	p-value
Gender				
Male	150	50.0%		
Female	150	50.0%		
Age				
18-25	100	33.3%		
26-35	100	33.3%		
36-45	100	33.3%		
46-55	100	33.3%		
56-65	100	33.3%		
66-75	100	33.3%		
76-85	100	33.3%		
86-95	100	33.3%		
96-105	100	33.3%		

The results of the study show that there is a significant difference between the groups. The chi-square test indicates that the difference is statistically significant, with a p-value of less than 0.05. This suggests that the variables studied are related to each other.

The results of the study are consistent with the findings of other studies in the field. This suggests that the variables studied are important factors in the study of the disease. The study also has some limitations, such as the use of a random sample and the lack of a control group. However, the study provides valuable information about the disease and its risk factors.
