# THEORY OF THE EARTH

## CHAPTER I. OF THE ORIGIN OF THE EARTH.

The origin of the earth is a subject which has occupied the minds of philosophers from the earliest ages. The ancients were divided into two schools, the one maintaining that the earth was created out of nothing, and the other that it was formed out of chaos. The moderns have generally adopted the latter opinion, and have endeavored to explain the origin of the earth by the laws of nature.

### SECTION I. OF THE ORIGIN OF THE EARTH.

The first question which presents itself to the mind is, whether the earth was created out of nothing, or whether it was formed out of chaos. The ancients were divided into two schools, the one maintaining that the earth was created out of nothing, and the other that it was formed out of chaos.

The moderns have generally adopted the latter opinion, and have endeavored to explain the origin of the earth by the laws of nature. They have supposed that the earth was formed out of a mass of gas, which condensed into a liquid, and then into a solid.

The first stage of the process was the condensation of the gas into a liquid. This was effected by the action of gravity, which caused the gas to collect in the center, and form a ball.

The next stage was the condensation of the liquid into a solid. This was effected by the action of heat, which caused the liquid to solidify.

The final stage was the formation of the earth's crust. This was effected by the action of fire, which caused the solid to melt, and then to solidify again.

The process of the formation of the earth's crust is described in the following manner: "The earth was formed out of a mass of gas, which condensed into a liquid, and then into a solid. The liquid condensed into a solid by the action of heat, and the solid condensed into a crust by the action of fire."

The process of the formation of the earth's crust is described in the following manner: "The earth was formed out of a mass of gas, which condensed into a liquid, and then into a solid. The liquid condensed into a solid by the action of heat, and the solid condensed into a crust by the action of fire."
