The elevation of the derrick floor above sea level is _____ ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

We propose to set a Baker Drillable Cement Retainer at Approximately 5100' and pump approximately 200 sacks cement below packer into perforations 5190-5210', run Gamma Ray Neutron from 3400-3900' and perforate San Andres zone which appears favorable from log. Will assume if original cement job is found to be undesirable.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
