The elevation of the derrick floor above sea level is 3266 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudlogging jobs, cementing points, and all other important proposed work)

The subject well has been shut in since 12-1-48 due to 200% water production. Prior to flooding out of oil since, the well also had an excessive gas-oil ratio of 147,800 cubic feet per barrel.

In an attempt to shut off water and increase oil production, it is proposed to run hole to 3997' and set a 4" OS liner on bottom, cemented with approximately 150 sacks cement. Liner will be perforated opposite favorable zones as indicated by Radioactivity survey and adjusted through perforations if necessary.

Your permission to proceed with the above remedial work is entailed is requested. A subsequent report of the results obtained will be forwarded as soon as possible.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
