In an effort to stimulate production we propose to squeeze permeable section from 4100' to 4143' with 100 sacks of cement, drill out retainer and deepen with reverse circulation until commercial pay or water is encountered. If water is encountered, well will be plugged back and acidized above squeezed section. If indications of commercial pay is found below present total depth, same will be acidized with 2000 gallons. If commercial well is not obtained, open formation above squeezed section will then be acidized with 2000 gallons.
