DETAILS OF WORK

Subject well has been drilled to TD 8124.

In accordance with verbal approval obtained 6-24-63, we propose the following:

- 1. If the evaluation by the NMFU members warrants testing of the San Andres formation, it is planned to set a 30 sack cement plug at 7450 ft. and set a 50 sack cement plug at 6000 ft. These plugs will cover the Aho Reef and Bone Springs respectively. We shall then run approximately 2100 ft. of 5 1/2" liner set at 6000 ft. and cement same with 250 sacks. Liner will be selectively perforated and treated with approximately 10,000 gals acid. After treatment well will be swabbed and tested.
- 2. If the evaluation by the NMFU members does not warrant the San Andres formation being tested, we then propose to partially abandon the well in the following manner:

Set a 40 sack cement plug from 7600-7412; a 75 sack cement plug from 6200-5840; set a 40 sack cement plug from 5650-5462; and set a 50 sack cement plug from 4100-3864. The surface pipe will then be capped off at the flange with a 2" valve. Intervals between plugs will be filled with 9 lb. mud.
