

quartz secondary decortication flakes were observed on the location at widely separated points. Anhydrous quartz nodules, residual from the Ogallala Formation which formerly mantled this landform, frequently occur as pedological inclusions in the environs of the Eunice Plain and the adjoining Laguna Valley. Remains of this type are attributable to en passant activities and more specifically to the peregrinations of task-specific social units engaged in hunting-related activities. Significant archaeological sites occur to the north in the vicinity of Monument Springs.

#### Recommendations

NMAS recommends clearance for Amoco Production Company's proposed Gillully Federal Gas Com. Well No. 17 and suggests that work-related activities proceed in accordance with company plans.
