1. The first step in the process is to identify the problem or issue that needs to be addressed. This involves gathering information and understanding the context of the problem.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The number of transformed cells was determined by the number of colonies obtained on the selective medium. The results are the mean of three independent experiments. Error bars represent standard deviation.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were incubated with the plant explants for 2 weeks. The explants were then cultured on the selective medium. The number of explants transformed was counted. The results are the mean \pm SD of three independent experiments. * indicates a significant difference ($p < 0.05$) between the control and the treated explants.

Figure 1 consists of five line graphs, labeled (a) through (e), each showing the percentage of correct responses (Y-axis, 0 to 100) for different groups of children (X-axis) across five conditions (1 to 5). The groups are: (a) 10-11 years, (b) 12-13 years, (c) 14-15 years, (d) 16-17 years, and (e) 18-19 years. The conditions are: 1. No feedback, 2. Feedback, 3. No feedback, 4. Feedback, 5. No feedback. The lines represent the percentage of correct responses for each group across the conditions. In general, the percentage of correct responses increases with age and with the number of conditions. The 18-19 years group (e) shows the highest percentage of correct responses, reaching nearly 100% for conditions 4 and 5. The 10-11 years group (a) shows the lowest percentage of correct responses, generally below 50%.
