This well has been producing from the Penrose-Skelly field formation, since July, 1938. The initial production after glycerin shot was 280 bbls. of oil per 24 hours. At present the well is pumping 4 bbls. of oil per day.

Following is a record of casing in well:

9-5/8" OD casing at 1214' with 275 saxs.
 7" OD casing at 3607' with 175 saxs.

It is the Magnolia's intention to drill this well deeper to test the Brunson field zone. A Caliper Survey will be made, and if necessary, the shot hole will be cemented. Rotary tools will be used to drill a 6-1/4" hole from the present depth of 3759' to approximately 7900'. 5" OD casing will be set on bottom and cemented with 325 saxs and perforated opposite the producing zone.
