Well is presently plugged and abandoned. It is proposed to re-enter and attempt to complete the well in the South Eunice Pool in the following manner:

Drill out 10 sack cement plug at surface & circulate drilling mud out of the well bore. Apply and maintain for one hour to the casing 1500 PSIG pressure to ascertain the effectiveness of the cement plug at 4237-4182. Provided the plug will hold pressure, perforate the intervals 3785-87', 3803-05', 3820-22', 3833-35', 3841-43', 3847-49', 3853-55', 3857-59', and 3874-76' w/1 JSPF. Stimulate the above intervals w/1500 gals 15% acid, followed by fracturing down the tubing and tubing-casing annulus at the rate of 25 BPM using 40,000 gals lease crude with 1-1/2 lb. 20-40 sand and 1/20 lb "ADOMITE" ADDITIVE per gallon. Test and place on production.
