DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

The well is currently producing as a gas well in the Jalisco oil. The well was completed 1-20-56 with an initial potential of 1000 psi. In 1955, the producing interval 435-455 (100') was tested. The well has a flow of 95 and is increasing. Since the 7" is increasing, it is indicated that the gas zone will soon be reached. Therefore, it is proposed to cement from 355-455 (100') as casing, log and seal with 100' of 100' liner into the 7" zone. This will perforate the gas zone and allow the gas to flow. If this fails it is recommended that the well be perforated from 455-475 (200') and be sealed in an attempt to produce as a gas well.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
