

ATLANTIC RICHFIELD COMPANY
Langley Greer Comm. No. 1
File No. 3202-10994
Procedural Page

The cores were preserved at the wellsite in a CO₂ atmosphere and transported to Midland by Core Laboratories, Inc. personnel.

A Core Gamma Log was recorded for downhole E-Log correlation.

Two sets of chips were taken from each core.

Core analysis was made from intervals requested on whole core diameter samples.

Fluid removal and fluid saturations were determined using controlled temperature vacuum retort techniques.

Porosity was determined using whole core summation of fluids.

Air permeability was measured in two horizontal directions in a Hassler sleeve.

The core was boxed after the analysis and remains at our Midland lab as we await further disposition instructions. Cores 3 and 4 are to be slabbed.
