13. Describe Proposed or Completed Operations (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work. If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)\*

The Paddock completion has been depleted and the Grayburg completion is producing less than 10 BOPD in this dual well. It is proposed to temporarily abandon the Paddock and test the San Andres formation as follows:

1. Mill out the permanent packer at 4050'.
2. Set a CIBP at 4450' above the Paddock.
3. Perforate the San Andres from 3992' - 4184'.
4. Set a packer at 3960' (below the Grayburg).
5. Acidize San Andres perforations with 3,000 gals 15% HCl.
6. Test pump to evaluate the San Andres.

Should this test show the San Andres to be economically productive, application will be made for a recompletion.

14. I hereby certify that the foregoing is true and correct
