The elevation of the derrick floor above sea level is _____ ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

It is our intention to drill a well at the above location to a TD of approximately 11,200' with rotary tools, in order to test the Allenburger formation for oil production.

All casing points will be cemented in accordance with approved methods of the USGS, and we shall comply with any special requirements.

It is planned to use the following casing pattern: 13 3/8" surface casing to be set at approximately 300' and cemented with 100 sacks to surface; 9 5/8" intermediate string to be set at approximately 5000' and cemented with 1000 sacks; 7" production string to be set at approximately 11,200' and cemented with 900 sacks.

Approval to produce this well upon completion is also requested.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
