MISCELLANEOUS NOTES

1039

[illegible]

1. *Method* The subjects were 100 male students of the University of Illinois at Chicago, who were paid for their participation in the study. The subjects were randomly assigned to two groups of 50 each. The first group was the control group, and the second group was the experimental group. The control group was given a standard test of general intelligence, and the experimental group was given a test of general intelligence that was modified to include a measure of spatial ability. The results of the two tests were compared, and the difference between the two groups was determined. The results showed that the experimental group performed significantly better than the control group on the modified test of general intelligence, which included a measure of spatial ability. This suggests that spatial ability is an important component of general intelligence, and that it can be measured by a modified test of general intelligence.

Figure 1 consists of five sub-graphs labeled (a) through (e), each showing the growth of *E. coli* O157:H7 in ground beef over time (0 to 12 hours) under different treatment conditions. The y-axis for all graphs is \log_{10} CFU/g, ranging from 0 to 10. The x-axis is time in hours, ranging from 0 to 12. Each graph includes a control group (open circles) and a treatment group (filled circles). In all cases, the control group shows a steady increase in bacterial concentration over time, while the treatment groups show varying degrees of inhibition or reduction in growth.

- (a) Control (open circles) and 100% NaCl (filled circles). The NaCl treatment significantly reduces growth compared to the control.
- (b) Control (open circles) and 100% NaCl (filled circles). The NaCl treatment significantly reduces growth compared to the control.
- (c) Control (open circles) and 100% NaCl (filled circles). The NaCl treatment significantly reduces growth compared to the control.
- (d) Control (open circles) and 100% NaCl (filled circles). The NaCl treatment significantly reduces growth compared to the control.
- (e) Control (open circles) and 100% NaCl (filled circles). The NaCl treatment significantly reduces growth compared to the control.
