

NEW MEXICO OIL CONSERVATION COMMISSION
Santa Fe, New Mexico

MISCELLANEOUS REPORTS ON WELLS

Submit this report in triplicate to the Oil Conservation Commission or its proper agent within ten days after the work specified is completed. It should be signed and sworn to before a notary public for reports on beginning drilling operations, results of shooting well, results of test of casing shut-off, result of plugging of well, and other important operations, even though the work was witnessed by an agent of the Commission. Reports on minor operations need not be signed and sworn to before a notary public. See additional instructions in the Rules and Regulations of the Commission.

Indicate nature of report by checking below:

Title

1. The first step in the process of identifying a problem is to recognize that a problem exists. This is often done by comparing current performance with a desired state or goal. Once a problem is identified, the next step is to define the problem more precisely. This involves determining the scope of the problem, the resources available, and the constraints that may be affecting the problem. The third step is to analyze the problem. This involves identifying the causes of the problem and the relationships between the different elements of the problem. The fourth step is to develop a solution. This involves identifying the different options available and evaluating the pros and cons of each option. The fifth step is to implement the solution. This involves putting the chosen solution into action and monitoring its progress. The sixth step is to evaluate the results. This involves comparing the actual results with the desired state and determining whether the problem has been solved. If the problem has not been solved, the process may need to be repeated.

Two of the authors (M. J. and J. S.) are grateful to the National Science Foundation for support of this work.
