

**NEW MEXICO OIL CONSERVATION COMMISSION**  
Santa Fe, New Mexico

**MISCELLANEOUS REPORTS ON WELLS**

Submit this report in triplicate to the Oil Conservation Commission or its proper agent within ten days after the work specified is completed. It should be signed and sworn to before a notary public for reports on beginning drilling operations, results of shooting well, results of test of casing shut-off, result of plugging of well, and other important operations, even though the work was witnessed by an agent of the Commission. Reports on minor operations need not be signed and sworn to before a notary public. See additional instructions in the Rules and Regulations of the Commission.

Indicate nature of report by checking below:

REPORT ON BEGINNING DRILLING OPERATIONS		REPORT ON REPAIRING WELL	
REPORT ON RESULT OF SHOOTING OR CHEMICAL TREATMENT OF WELL		REPORT ON PULLING OR OTHERWISE ALTERING CASING	
REPORT ON RESULT OF TEST OF CASING SHUT-OFF	<b>X</b>	REPORT ON DEEPENING WELL	
REPORT ON RESULT OF PLUGGING OF WELL

THE EFFECT OF THE INFLUENZA VIRUS ON THE RESPIRATORY TRACT OF MAN. A. J. COOPER, M.D., and J. H. HARRIS, M.D., University of Chicago, Chicago, Ill.

THE EFFECT OF THE INFLUENZA VIRUS ON THE RESPIRATORY TRACT OF MAN.

The purpose of this study was to determine the effect of the influenza virus on the respiratory tract of man. The subjects of the study were ten healthy men, aged from 20 to 30 years, who had no history of influenza or other respiratory disease. They were all students of the University of Chicago and were paid for their participation in the study.

The subjects were divided into two groups of five. The first group was given a nasal spray of the influenza virus, and the second group was given a nasal spray of sterile saline solution. The subjects were then observed for a period of ten days, during which time they were kept in a hospital and their symptoms were recorded.

RESULTS.—The results of the study are as follows:

1. The subjects who received the influenza virus spray all developed symptoms of influenza within a period of ten days.

2. The subjects who received the sterile saline spray all remained free of symptoms throughout the ten-day period.

3. The symptoms of influenza in the subjects who received the virus spray were of the same type and severity as those reported by subjects in other studies.

4. The subjects who received the virus spray all recovered within a period of ten days, and none of them developed any complications.

5. The subjects who received the sterile saline spray all remained free of symptoms throughout the ten-day period, and none of them developed any complications.

CONCLUSIONS.—The results of this study indicate that the influenza virus is capable of producing influenza in man, and that the virus is transmitted by the nasal spray.

REMARKS.—This study was supported by a grant from the National Institute of Health, U. S. Department of Health, Education and Welfare.
