THE EFFECT OF VITAMIN DEFICIENCY ON THE GROWTH OF THE RAT

By J. W. L. Lusk, M.D., and J. W. Lusk, Jr., M.D., University of Illinois, Urbana, Ill.

Received for publication, February 1, 1935.

The purpose of this study was to determine the effect of vitamin deficiency on the growth of the rat. The rats were divided into two groups, one receiving a normal diet and the other a diet deficient in vitamins. The results showed that the rats on the deficient diet grew significantly slower than those on the normal diet.

The growth of the rats was measured by weighing them at regular intervals. The rats on the normal diet gained weight steadily, while the rats on the deficient diet showed a marked decrease in weight gain.

The results of this study indicate that vitamin deficiency has a profound effect on the growth of the rat. This finding is of importance in understanding the role of vitamins in human nutrition.

The study was conducted in the laboratory of the University of Illinois, Urbana, Ill. The authors wish to thank the following for their assistance: J. W. Lusk, Jr., M.D., and J. W. Lusk, M.D.
