SUBLECT: Dual Completion Southland Royalty A No. 4, Tubb and Drinkard Fields

New Mexico Oil Conservation Corrission (2) Santa Fe, New Mexico

Gentlemen:

Oil Conservation Commission Order No. BC-104 dated April 21, 1954, approved dual completion in the Tubb and Drinkard formations of Stanolind's Southland Royalty "A" No. 4 located 660 feet from the South and East lines of Section 4, T-21-S, R-37-E, Lea County, New Mexico. The order, among other things, stipulated that upon the actual dual complation a diagrammatic sketch of the mechanical installation which was actually used to complete and produce the seal between the strata and a special report of production, gas-oil ratio and reservoir pressure of each producing zone would be filed.

In accordance with the aforementioned order the following data are furnished:

Following a 72 hour shut-in period of both pays on Hay 4, 1954, the bottom hole pressure of both pays was determined at a datum of -2792', which is at a depth opposite casing perfersions in the Tubb pay. The pressure as determined with a bomb in the tubing of the Brinkard was 1635 psig. At the same datum the pressure in the annulus as determined from the surface pressure and corrected by the use of acoustic well sounding equipment was 2473 psig for the Tubb. Surface tubing pressure was 1332 psig and surface casing pressure was 2034 psig.

During a test on April 4, 1954 the Tubb flowed at a rate of 647 MCFPD with a gas liquid ratio of 13,479 cu. ft. per barrel through a $12/64^{n}$ choke with a flowing casing pressure of 1854 psig. On a production test of the Drinkard on April 7, 1954 the well produced 108 BO and 0 BN in 22 hours with a GOR of 442 through a $24/64^{n}$ choke. The flowing tubing pressure was 225 psi.
