Mr. A. C. Lamm - Lunice, New Mexico 10:13

Block 10, Section 10 - State 10 well 3 - Section 10,
T. 21S, R. 17E, Sec. 30B21, New Mexico

On May 5, 1955, a back pressure test was taken to determine the theoretical open flow capacity of the Tubb gas zone at zero bottom hole pressure, and the deliverability characteristics at various rates of flow. A calculated open flow potential of 1200 scf per day was obtained, based on a ten hour back pressure test.

Attached are curves representing the calculated open flow potential and deliverability, and a chart tabulating the data obtained by this test.

Calculated open flow potential	1200	scf/D
Deliverability at 600 psig	1110	scf/D
Deliverability at 150 psig	1195	scf/D
Shut in pressure	1843.2	psig

Gas & solid content of gas is not available at this time.

ILLEGIBLE

B. A. McGinnis
