Mr. A. C. Lamm - Sunice, New Mexico

Block 11 - Section 10 - STAT. 10 NO. 23 - SECTION 10,
T. 21S, R. 37E, L. 4A, S. 10N, N. 10E

On August 9, 1955, a back pressure test was taken to determine the theoretical open flow capacity of the Blinbry gas zone at zero bottom hole pressure, and the deliverability characteristics at various rates of flow. A calculated open flow potential of 3280 MCF gas per day was obtained, based on an eight hour back pressure test.

Attached are curves representing the calculated open flow potential and deliverability, and a chart tabulating the data obtained by this test.

Calculated open flow potential	3280	MCF/D
Deliverability at 0.0 psig	2922	MCF/D
Deliverability at 100 psig	3215	MCF/D
Shut in pressure	1916.2	psia

The well flowed 65 API distillate thru 1" choke.
Gravity 62 based on an eight hour back pressure test.
