Figure 6 shows the results of the regression analysis. The dependent variable was the number of days off work due to musculoskeletal problems. The independent variables were age, sex, years since last injury, and the three risk factors. The model explains 70% of the variance ($R^2 = .70$). The regression equation is:

$$Y = -1.89 + .002X_1 + .000X_2 + .000X_3 + .000X_4$$

where X_1 = age, X_2 = sex, X_3 = years since last injury, and X_4 = risk factor score.

1. The first step is to identify the key components of the system. This includes understanding the hardware, software, and data involved. For example, in a web application, this might involve identifying the server, database, and client-side code.

1. The first step in the process of creating a new product is to identify a market need. This involves conducting market research to determine what consumers want and what problems they are trying to solve. Once a need is identified, the next step is to develop a concept for a product that addresses that need.
