Mr. R. C. Lannen - Eunice, New Mexico

BACK PRESSURE TEST - WELD NO. 2-3, SECTION 21,
TOWNSHIP 21 SOUTH, RANGE 37 EAST, LEA COUNTY,
NEW MEXICO

On April 24, 1956, a back pressure test was taken to determine the theoretical open flow capacity of the Blinebry gas zone at zero bottom hole pressure, and the deliverability characteristics at various rates of flow. A calculated open flow potential of 3810 MCF gas per day was obtained, based on a ten-hour back pressure test.

Attached are curves representing the calculated open flow potential and deliverability, and a chart tabulating the data obtained by this test.

Calculated open flow potential	3810	MCF/D
Deliverability at 600 psig	3700	MCF/D
Deliverability at 150 psig	3600	MCF/D
Shut in pressure	1864.2	PSIA
GRG and acid content of gas is not available at this time.

19. 10. 1962. 100% of the plants were infested with the caterpillars.

*Dear Mr. [unclear]
I am enclosing
the following
for your
information.
Yours very
obliged,
John [unclear]*
