1. *Journal of the American Medical Association*, 1997; 278: 1039-1044.

The figure consists of two separate line graphs. The left graph plots 'Rate of reaction' on the y-axis against 'Temperature / °C' on the x-axis. The x-axis has markings for 10, 20, 30, and 40. The curve starts at a low rate at 10°C, rises to a peak at 30°C, and then begins to decline at 40°C. The right graph also plots 'Rate of reaction' on the y-axis against 'Temperature / °C' on the x-axis. The x-axis has markings for 10, 20, 30, and 40. This curve shows a steep, nearly exponential increase in the rate of reaction as temperature rises from 10°C to 40°C, where it appears to level off.
