

8. Logging, Testing and Coring Program:

A. No DST's are planned.

B. The open hole logging program will be:

Comp. Neutron / Spectral Lithodensity/ GR/ CAL/ DLL/ MSFL/ BHC
SONIC

C. The bottom 300' of 7-7/8" hole will be conventionally cored.

9. Abnormal Pressures, Temperature and Potential Hazards:

No abnormal pressures or temperatures are foreseen. The anticipated bottom hole temperature at total depth is 100 degrees and maximum bottom hole pressure is 2300 psig. No hydrogen sulfide gas has been reported or is known to exist at these depths in this area. No major loss circulation intervals have been encountered in adjacent wells.

10. Anticipated Starting Date and Duration of Operations:

Road and location preparation will not be undertaken until approval has been received from the BLM. The anticipated spud date is approximately January 15, 1997. The drilling operations should require approximately 12 days. If the well is deemed productive, completion operations will require, at minimum, an additional 30 days of testing to ascertain whether permanent production facilities will be constructed.
