DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

We propose to drill the above well to total depth of 3900 feet and complete in the Seven Rivers formation in the approximate interval 3800' to 3900'. We propose to set 10-3/4" casing at 250 feet and cement with sufficient cement to fill the annular space from the shoe to the surface. We propose to run 7" casing to a depth of 3900 feet and by using a Halliburton stage collar cement from the shoe of the oil string to the base of the salt and then place 200 sacks of cement through the stage collar at the top of the salt. We propose to complete the well in the Seven Rivers formation by perforating the oil string opposite porous sections.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
