DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Average production for the last 6 months from subject well has been 640 MCF/mo.

We propose to clean out fill and restore well to full production in the following manner: Kill well with oil; pull tubing; run in with bit and circulate to bottom, adding permaseal as necessary to maintain circulation; rerun tubing to 3005' and snub well off.

A subsequent report will be filed upon completion of this work.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
