The elevation of the derrick floor above sea level is 3422 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cement-ing points, and all other important proposed work)

To increase production, we propose to do the following work:

- Kill well with oil, pull and rerun 2" tubing open ended. 1.
- Fracture with 20,000 gallons of refined oil carrying  $l\frac{1}{2}$  pounds of sand per gallon in two-10,000 gallon stages down 5" casing 2. and 2" tubing simultaneously employing temporary plugging material.
- Swab to flowing status, recover load oil, test, return well to 3. production.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
