THEORY OF THE EARTH

CHAPTER I

THE EARTH AND ITS HISTORY

The Earth is a planet of the solar system, and is the only one of the planets which is known to support life. It is a sphere, and is composed of a solid inner core, a liquid outer core, and a solid crust. The crust is the outermost layer, and is composed of the rocks and minerals which form the surface of the planet. The outer core is a layer of molten metal, and is believed to be the source of the Earth's magnetic field. The inner core is a solid sphere of metal, and is believed to be the source of the Earth's heat. The Earth's history is a long and complex one, and is the subject of much scientific study. The study of the Earth's history is known as geology, and is a branch of the natural sciences. The study of the Earth's history is important because it helps us to understand the processes which have shaped the planet, and the changes which have taken place over time. The study of the Earth's history is also important because it helps us to understand the processes which have shaped the life on the planet, and the changes which have taken place over time.
