Position Field Manager

Send Communications regarding well to:

Name CARTER FOUNDATION PRODUCTION COMPANY

Address P. O. Box 1688, Kernit, Texas

This well ceased to produce from the target horizon and has been non-productive and since August 1961.

We are now drilling an exploration well in the target horizon. The well is being drilled in the target horizon and the following manner:

Set pressure packer at 6,700 feet and squeeze off all open perforations below that point.

Run completion Gamma Ray and Neutron Survey from top of said plug to surface and perforate as determined from the log opposite the trap gas horizon between 3075 and 3100 feet, perforate with 2,000 gallons acid and 10 sufficient gas is not obtained, then give well fracture treatment of 30,000 gallons kerosene or distillate with one and one-half barrels per gallon.

After tubing has well is completed, well from 3110 feet well with suitable material and set production packer at 3100 feet. Perforate casing opposite Gamma Ray Gas horizon as determined from above mentioned log between 3140 feet and 3100 feet, perforate with 3,000 gallons acid and test, then if necessary treat with 20,000 gallons kerosene or distillate with one and one-half barrels sand per gallon. Run tubing with packer string and circulate hole clean, insert string in production packer, wash in clean water, then close side door choke and set at 5,500, recover to 3110 feet and wash in trap zone.
