Re: Wellbore Commingling
A. H. Blinebry Federal (NCT-4)
Well No. 5
Blinebry and Drinkard Pools
Lea County, New Mexico

Attention: Mr. A. L. Porter, Jr.

Gentlemen:

Texaco Inc. requests administrative approval to commingle in the wellbore oil production from the Blinebry and Drinkard pools in Well No. 5 on the A. H. Blinebry Federal (NCT-4) Lease located in Section 31, Township 22 South, Range 38 East, Lea County, New Mexico.

The subject well is presently producing from both zones. Upon approval of this application the Blinebry and Drinkard zones will be commingled downhole by perforating from 6870'-6875' and 6935'-6940'. Both zones will be classified as oil zones. The Drinkard zone is being produced by artificial lift; therefore, production after commingling will be by artificial lift. The fluids from these two reservoirs are known to be compatible. Ownership of the minerals in both zones is common, and the value of the commingled fluids is not less than the total value of the fluids if they were marketed separately. Secondary operations will not be jeopardized by approval of this application.

A data sheet is attached listing all required data for the Drinkard and Blinebry zones. Also attached are production decline curves, diagrammatic sketches of the wellbore showing the present completion and proposed completion, and a bottomhole pressure survey. A well test is included as submitted on Form C-116.

Copies of this application are being mailed to each of the Offset Operators shown on the attached list and to the USGS.

Yours very truly,

J. V. GANNON

J. V. Gannon

No well will be assigned an allowable greater than the amount of oil produced on the official test.

During gas-oil ratio test, each well shall be produced at a rate not exceeding the top unit allowable for the pool in which well is located by more than 25 percent. Operator is encouraged to take advantage of this 25 percent tolerance in order that well can be assigned increased allowables when authorized by the Commission.

Gas volumes must be reported in MCF measured at a pressure base of 15.025 psia and a temperature of 60° F. Specific gravity base will be 0.60.

Report casing pressure in lieu of tubing pressure for any well producing through casing.

Mail original and one copy of this report to the district office of the New Mexico Oil Conservation Commission in accordance with Rule 301 and appropriate pool rules.
