PAYNE HYDRO-PNEUMATIC REGULATOR

The Payne Hydro-Pneumatic Regulator has completely revolutionized pressure control in blowout preventer operating systems. No other regulator has comparable capacity, sensitivity, or leak proof operation.

Some sealing elements in blowout preventers can be damaged by excessive pressure. The Payne Hydro-Pneumatic Regulator greatly reduces this possibility and expense.

Payne regulators shut off bubble tight and will maintain any desired reduced pressure on a continuous basis. The self-relieving feature makes it possible to maintain the set pressure even while stripping tool joints through an annular type blowout preventer.

The Payne Sub-Sea Regulator can be remotely controlled at distances up to 1000 feet and more. This regulator has been used with great success in Payne sub-sea control pods. There is no other regulator available that will perform this particular service.

*For Air Operation
in Surface Applications*

*For Hydraulic Operation in
Remote or Sub-Sea Applications*
