1. The first step in the process of the investigation is to determine the scope of the problem. This involves identifying the specific areas of concern and the potential causes of the problem. Once the scope is determined, the next step is to gather data. This can be done through a variety of methods, including interviews, surveys, and observation. The data gathered should be analyzed to identify patterns and trends. Finally, the results of the investigation should be reported to the appropriate authorities. This report should include a clear statement of the problem, a description of the methods used, and a summary of the findings. It should also include recommendations for how to address the problem and prevent it from occurring again.

[illegible]

It is of the greatest importance to have a complete history of the well. Please state in detail the dates of redrilling, together with the reasons for the work and its results. If there were any changes made in the casing, state fully, and if any casing was "sidetracked" or left in the well, give its size and location. If the well has been dynamited, give date, size, position, and number of shots. If plugs or bridges were put into test for water, state kind of material used, position, and results of pumping or bailing.
