Re: J.L. Coates #4
Conversion to Injection
990 FNL, 1650 FWL, Sec. 10, T24S, R36E
Lea County, New Mexico

We received verbal permission for commencement of recompletion of the referenced well from Mr. Mike Stogner on May 29, 1984 (case #8129). The application described the removal of two CIBP's, cementing a scab liner across all perforations and subsequent perforation of the Seven Rivers formation.

Circumstances dictated altered procedures, and the result is that there is a Baker Lok-Set set at 3483'. All perforations above the packer have been squeezed and the packer annulus was tested to 500 psi. Beneath the packer are existing perforations at 3492-3496 and a CIBP at 3505. We are injecting water into the existing perforations at 3492-3496. Verbal permission to proceed as such was received from your office on 6/8/84. Present injection pressure is 0 psig at 2 BPM. No stimulation was required.

Please advise us regarding any procedures we should take to document Commission approval of our status and any information we may supply. Thank you for your assistance.

Jim Garrett
Engineer
