Title

OIL & GAS INSPECTOR

THEORY OF THE EARTH

CHAPTER I. OF THE ORIGIN OF THE EARTH.

THE first question which presents itself to the mind, is, what was the cause of the origin of the earth? and the answer is, that it was the result of a process, which has been going on ever since the beginning of time. The earth is not a solid body, but a collection of particles, which have been attracted together by the force of gravity, and have formed a mass, which is now the earth. The particles were at first in a state of confusion, and were attracted towards a common centre, and as they approached, they became more and more condensed, and at last formed a solid mass. The process of condensation was continued, until the earth had attained its present size, and then it was cooled, and the elements of the atmosphere were formed. The earth is now a solid body, and the elements of the atmosphere are formed, and the earth is now a solid body, and the elements of the atmosphere are formed.

THE SECOND QUESTION, is, what was the cause of the origin of the atmosphere?

THE answer is, that it was the result of a process, which has been going on ever since the beginning of time. The atmosphere is not a solid body, but a collection of particles, which have been attracted together by the force of gravity, and have formed a mass, which is now the atmosphere. The particles were at first in a state of confusion, and were attracted towards a common centre, and as they approached, they became more and more condensed, and at last formed a solid mass. The process of condensation was continued, until the atmosphere had attained its present size, and then it was cooled, and the elements of the atmosphere were formed. The atmosphere is now a solid body, and the elements of the atmosphere are formed, and the atmosphere is now a solid body, and the elements of the atmosphere are formed.

THE THIRD QUESTION, is, what was the cause of the origin of the water?

THE answer is, that it was the result of a process, which has been going on ever since the beginning of time. The water is not a solid body, but a collection of particles, which have been attracted together by the force of gravity, and have formed a mass, which is now the water. The particles were at first in a state of confusion, and were attracted towards a common centre, and as they approached, they became more and more condensed, and at last formed a solid mass. The process of condensation was continued, until the water had attained its present size, and then it was cooled, and the elements of the water were formed. The water is now a solid body, and the elements of the water are formed, and the water is now a solid body, and the elements of the water are formed.

THE FOURTH QUESTION, is, what was the cause of the origin of the life?

THE answer is, that it was the result of a process, which has been going on ever since the beginning of time. The life is not a solid body, but a collection of particles, which have been attracted together by the force of gravity, and have formed a mass, which is now the life. The particles were at first in a state of confusion, and were attracted towards a common centre, and as they approached, they became more and more condensed, and at last formed a solid mass. The process of condensation was continued, until the life had attained its present size, and then it was cooled, and the elements of the life were formed. The life is now a solid body, and the elements of the life are formed, and the life is now a solid body, and the elements of the life are formed.
