Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were grown in the medium containing 100 mg/l of tetracycline. The cell concentration of the strains was adjusted to 10⁸ cells/ml. The cells were then mixed with the plant protoplasts and cocultured for 48 h. The cells were then separated from the protoplasts and the protoplasts were cultured on the medium containing 100 mg/l of tetracycline. The transformation efficiency was determined by the number of colonies formed on the medium. The results are shown as the mean \pm SD of three independent experiments.
