regarding liquid production, however none of the operators have separators at their Jalmat gas wells and a check of their production records show that no liquids are being produced.

Considering the above factors, it is believed that a siphon string would not be necessary in this well in order to efficiently produce the Jalmat gas. We therefore respectfully request administrative approval for the dual completion of the Eaves A-19 No. 8, utilizing one string of tubing, as shown on the attached schematic drawing of the "Proposed Method of Dual Completion."

Very truly yours,

being little production, however none of the operators were  
of interest as their latest gas wells and a check of their gas  
production records show that no liquids are being produced.  
The reason for this is that, as is believed, the  
gas wells are not being operated in this field in order to  
obtain maximum production. The operators are not interested  
in the production of the field, but in the production of the  
gas wells, which is being operated as shown on  
the attached schedule showing the proposed section of land  
production.

Very truly yours,

WILLIAM A. HARRIS
