U. S. GEOLOGICAL SURVEY
HOBBS, NEW MEXICO

17. DESCRIBE PROPOSED OR COMPLETED OPERATIONS (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work. If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)*
Currently the well uses three strings of tubing to produce Blinbry oil, Tubb gas, and Drinkard oil. The Tubb gas string has become completely plugged off and Drinkard is near abandonment. In order to increase production of Tubb gas, we propose to blank off Drinkard, perforate Drinkard tubing, and use it to produce Tubb gas.

A blanking plug will be run in Drinkard string and set in the seating nipple at 6852'. Drinkard tubing will then be perforated at intervals 6199'-6201', 6230'-6232', 6240'-6242', 6262'-6264' with one JSPF. These perforations are adjacent to the existing Tubb perforations. Perforations will be acidized with 2000 gallons 15% NE-HCL. After productivity is evaluated, well will be returned to production.
