Clean out

Production had declined to 4 bbls. per minute. The following work was done to restore it to production:

- 1) Moved in and rigged up workover rig. Pulled 5-1/2" tubing and pump.
- 2) Ran bit and cleaned out 3552' - 4500'. Recovered silt, sand and iron sulphide particles.
- 3) Reran 5-1/2" tubing and pump and returned well to production status on September 5, 1971, producing 15,840 bbls. water per day from open-hole section 3875' - 4500' of the Capitan Reef formation.
