# THEORY OF THE EARTH

The theory of the earth is a branch of geology which deals with the origin and development of the earth and its various parts. It is a science which seeks to explain the processes which have shaped the earth and its features. The theory of the earth is based on the study of the earth's structure and its history. It is a science which is constantly developing and changing as new discoveries are made and new theories are proposed.

## CHAPTER I

The earth is a sphere which is composed of various layers. The outermost layer is the crust, which is the solid part of the earth. Below the crust is the mantle, which is the hot, plastic part of the earth. At the center of the earth is the core, which is the innermost part of the earth. The crust, mantle, and core are the three main layers of the earth.

## THE CRUST AND THE MANTLE

The crust is the solid part of the earth. It is the layer of the earth which we live on. The mantle is the hot, plastic part of the earth. It is the layer of the earth which is below the crust.
