DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

To increase production on this well we have done the following work:

1. Acidize McKee section from 8050' to 8119' in two stages each consisting of 1000 gallons LST NEA 15% with 250 gallons Gel acid carrying one pound per gallon naphthalene between stages. Limiting the bottom hole treating pressure to an amount less than the bottom hole collapse pressure of the 2-3/8" casing.
2. This work failed to increase production, therefore we are submitting another Sundry Notice requesting additional work be done on this well.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
