DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

In order to recomplete the above well in the Yates formation we propose the following: Plug back above Langlie-Mattix pay as indicated by log with 100 sacks cement. Perforate all well developed Yates stringers as indicated by log. Stimulate perforations down casing with 40,000 gallons of water containing 40,000 pounds of sand. Test well and return to production.

Copies of Anderson Prichard's letter of October 10, 1957, releasing this well from the Langlie Unit repressuring project are attached.

3/6/58—The approval is subject to the condition that the bottom perforation from which the well is to be recompleted be above sea level.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
