The elevation of the derrick floor above sea level is _____ ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

This well is dually completed in the Blinebry (5338-5160') and Tubb (5824-60') zones. An investigation indicated communication between these two zones. We propose to pull both strings of tubing, rerun Tubb tubing and set in Model #111 packer at 5595', and cement through Tubb perforations in an attempt to cement the zone of communication. If the cement job is successful we propose to acidize the Blinebry Zone and place well back on production.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
